REGIONAL ECONOMIC INDICATORS: BUSINESS AND INNOVATION CLIMATE

Prepared by:
The Center for Economic Development
Maxine Goodman Levin College of Urban Affairs
Cleveland State University

as part of
The CSU Presidential Initiative for Economic Development

August 4, 2004

ACKNOWLEDGMENT

The Center for Economic Development and the Program for the Advancement of Economic Development in Northeast Ohio would like to thank the main author, Robert Sadowski, along with the research team of Mukesh Kumar and Maria Haller. In addition, we would like to thank the Center's Director, Dr. Ziona Austrian, and Dr. Jim Robey, the project's external partner, for developing the framework for the indicators project as well as their contributions and insightful comments throughout this report. Dr. Robey was previously the Research Director of the Greater Cleveland Growth Association and is currently serving in a similar capacity with TeamNEO.

INTRODUCTION

This report is the first in a series to be released by the Center for Economic Development (Center) at Cleveland State University's Maxine Goodman Levin College of Urban Affairs as part of its regional economic indicators project. The project's objective is to provide a comprehensive benchmarking of Greater Cleveland's economy against other metropolitan areas across the nation. To achieve this objective, the Center is planning to analyze a broad set of economic indicators in several themes to construct a broad-based economic profile of the region. This will allow for an objective determination of areas in which Cleveland and northeast Ohio lead or lag regions that are considered comparable. This report focuses on economic indicators associated with business and innovation climate. Other themes to be released in the future include human capital; broad economic indicators (employment, income, and output); globalization; real estate; quality of life; and social indicators.

In each of these themes, the geographic unit examined is a metropolitan area. The research team chose not to compare northeast Ohio's metro areas to the largest areas in the country, but to develop a set of comparable areas based on several criteria. To be included, the area had to be similar in size to the Cleveland area in terms of population and/or labor force. The area had to also meet one of the following three criteria: similar industry structure, location in midwestern states, or being a high-growth region (in terms of labor force). Appendix D provides more details related to the selection criteria. Thirty-two metropolitan areas across the U.S. were identified as being comparable with Cleveland metro area. In addition, the three smaller metro areas in northeast Ohio (Akron, Canton, and Youngstown) that did not meet these criteria were included because they are part of the northeast Ohio region. As a result, they were not expected to rank highly in any of the indicators or the business and innovation climate index. In total, 36 metro areas are included in the description and ranking in this report.

The economic indicators that comprise the theme of business and innovative climate include Small Business Innovation Research (SBIR) and Small Business Technology Transfer STTR awards, venture capital, initial public offerings (IPOs), high-tech employment share, research and development funding, patents, business incubators, corporate headquarters, and business costs. These indicators provide different ways of capturing a region's propensity to conduct research, transfer basic research to development and

commercialization, innovate, promote entrepreneurship, and develop and sustain a technology-based economy.

This report includes four sections. Following the introduction, the second section describes the business and innovation climate index, which offers an aggregated measure used to benchmark northeast Ohio's metropolitan areas against comparable regions. The third section provides some observations on Northeast Ohio's strengths and weaknesses based on the index and individual indicators presented throughout the report. The final section discusses each of the nine economic indicators in detail.

BUSINESS AND INNOVATION CLIMATE INDEX

The business and innovation climate index aggregates key microeconomic variables for each of the 36 comparable metropolitan areas into a single operational measure. This provides a simple way to benchmark the Cleveland area (and other northeast Ohio areas) against other regions. The index is comprised of eight indicators, each with one or more variables. First, a sub-index was calculated for each of the indicators, and then the indicators were combined to create the business and innovation climate index. Appendix C summarizes the steps used to construct the index. Table C-1 in the appendix provides a list of indicators and their variables.

The aggregated (overall) index and each of the sub-indices have a range from 1 (worst) to 10 (best). Although some variables had available data through 2003, many others did not. The common denominator year was 2001.¹ All indicators discussed later in this report are included in the index, except for business incubators. The primary reason is that no time frame is associated with the data.

Table 1 presents the index and rank for each of the 36 metropolitan areas. It also shows the rank for each of the eight indicators included in the index. Table C-2 in Appendix C estimates the actual scores for every sub-index in each of the metro areas. The top five comparable metro areas (in order of rank) are San Diego, Seattle, Minneapolis, Austin, and St. Louis. Minneapolis, third overall, is the highest ranked area in the Midwest.

The Cleveland metro area ranked 11th overall. Sub-indices contributing significantly to Cleveland's ranking are research and development (R&D), patents, and headquarters. Cleveland's number six ranking in the R&D sub-index is primarily due to the number and dollar value of National Institutes of Health (NIH) awards given to area universities, independent hospitals, medical schools, and research institutes. The number of patents awarded to Cleveland area inventors placed the region 8th in the patent sub-index. This ranking may be partially attributed to an outgrowth of the R&D activity. Cleveland was tied with Seattle for 2nd in the headquarter sub-index. One reason often cited for the large number of headquarters (which has decreased since 2001) is the area's industrial heritage dating back to the late 19th century.

¹ Business costs data are the sole exception. It uses 2002 data since data for 2001 was not available.

As expected, because of their smaller size, other northeast Ohio metro areas did not rank as high as the Cleveland area. Moreover, Canton and Youngstown ranked the lowest, 35th and 36th, respectively. Akron did somewhat better at 29. These areas scored low because they did not meet the criteria for inclusion on the comparable metro area list. However, the Akron metro area showed some strength. Within the sub-indices, Akron ranked 17th among the 36 metro areas in patents. This is attributed to the polymer research and production that is present in the Akron region. It ranked 20th in SBIR/SBTT awards and tied for 21st place with several other areas in headquarters.

SBIR: Small Business Innovation Research/Small Business Technology Transfer awards

VC: Venture Capital

IPO: Initial Public Offering

EMP: High-Tech Employment Share

R&D: Research and Development

Patents: Utility Patents

HQs: Fortune 500 Corporate Headquarters

Costs: Cost of Doing Business

For a description of each sub-index and its associated variables, refer to the section titled "Business and Innovation Climate-Economic Indicators" and Appendix C.

Aggregated Index: Matching indices in Table 1 are due to rounding for presentation. The associated rank order is correct.

In 2001, no IPO activity was reported in 27 of the 36 comparable metro areas. The result is that 27 metro areas are ranked 10th.-Only 15 IPOs were issued across all 36 metro areas in 2001.

Prepared by: Center for Economic Development, Maxine Goodman Levin College of Urban Affairs, Cleveland State University

SUMMARY OBSERVATIONS

- Cleveland's overall ranking (11th) is relatively high among the 36 comparable regions. However, it is significantly below the top three – San Diego, Seattle, and Minneapolis. These metro areas reported an average business and innovation climate index of 7.01 compared to Cleveland's 3.73. In fact, the top three metro areas report significantly higher indices than the 4th and 5th ranked metro areas, Austin (5.52) and St. Louis (4.36).
- The sub-index that brings down Cleveland's ranking is business costs. In this sub-index, Cleveland ranked 30th. If business costs were not included as a sub-index, Cleveland would have ranked 9th among the 36 comparable regions.
- Research and development is one of the Cleveland metro area's strengths. The latest data show that local institutions and businesses ranked 5th among the 36 comparable regions in attracting NIH funding, 10th in university-related R&D expenditures, and 7th in the number of SBIR/STTR awards. These monies do not include NASA Glenn's research budget. The importance of University Circle and the Mid-Town areas of Cleveland cannot be over-estimated, as hospitals, universities, and businesses located there received more than 95 percent of the NIH funding that flowed into the local area. The natural progression of R&D work is the receipt of patents. Cleveland again did very well, ranking 8th in patents issued from 1994 through 2003.
- The indicators suggest that institutions and businesses in Cleveland are more successful in R&D than in commercializing results. This is confirmed by measures related to venture capital (VC), initial public offerings (IPOs), and high-tech employment. The Cleveland metro area ranked 21st in attracting venture capital. The top five metro areas had over 16 times, on average, the amount of VC funding invested in their startup companies as did companies in Cleveland. There was no IPO activity in the Cleveland metro area between 2000 and 2003, and the Cleveland area had a low ranking of 26 in high-tech employment share. In fact, the Cleveland area reported a decrease in the share of high-tech employment each year from 2000 through 2003.

- Concentrated efforts by Case Western Reserve University, Cleveland State University, The University of Akron, the NASA Glenn Research Center, and intermediaries such as NorTech, JumpStart, BioEnterprise, and the Ohio Aerospace Institute in the area of technology commercialization should increase venture capital invested in Cleveland and slow the area's high-tech brain drain.

BUSINESS AND INNOVATION CLIMATE – ECONOMIC INDICATORS

This section describes each of the nine economic indicators. It explains what the indicator measures, why it is used, and shows how Northeast Ohio metro areas rank compared to other metro areas in the Great Lakes region as well as to the top and bottom ranked areas. Detailed tables of all 36 metro areas are included in appendix B.

SBIR & STTR AWARDS

The Small Business Innovation Research (SBIR) and Small Business Technology Transfer (STTR) programs are federal government initiatives designed to stimulate technological innovation and provide opportunities for small businesses. Their purpose is to support private-sector R&D through set-aside funding earmarked for promising technologies that are not yet commercially viable.

The SBIR program provides competitive grants in two phases to entrepreneurs seeking to conduct proof-of-concept research for technical merit (Phase I) and feasibility and prototype development (Phase II). SBIR program solicitations are issued by 11 federal agencies.² The STTR program is a similar but smaller initiative aimed at partnerships between small businesses and nonprofit research institutions (including universities) to advance technology transfer. Five federal agencies reserve a portion of their R&D budgets for STTR grants.

SBIR and STTR awards are seen as a measure of entrepreneurship and technological innovation. Both programs are important sources of financing for entrepreneurs. For many start-up companies, they constitute the initial revenue stream and can make the difference between “go” and “no-go” decisions. Program participants can leverage the credibility associated with the award and the experimental data developed through their research to attract strategic partners and outside capital.

Among the 36 comparable metropolitan areas, Cleveland ranked in the top third in both number and dollar value of SBIR/STTR awards in 2000 and 2001. The highest-ranking metro areas included Austin, Denver, Minneapolis, San Diego, and Seattle. In 2001, Cleveland ranked 7th and Akron ranked 18th in number of awards. However, when looking at total award value, Cleveland’s ranking fell to 11th and Akron dropped to 19th. The overall variation in award rankings across all metro areas between 2000 and 2001 was small. Figure 1 shows a comparison of total SBIR/STTR awards in selected MSAs in 2001. The profile in Figure 1 also

² Participating agencies include the Departments of Agriculture, Commerce, Defense, Education, Energy, Health and Human Services, Homeland Security, Transportation, the Environmental Protection Agency, NASA, and the National Science Foundation.

accurately reflects the award activity in 2000. Table B-1 in Appendix B lists the number of awards, the number of companies receiving awards, and total award value for all metropolitan areas in 2000 and 2001.

Figure 1. Number of SBIR/STTR Awards in Selected MSAs, 2001

Notes:

Metro areas represented include those located in the state of Ohio, the five highest ranking, and others in the Great Lakes region.

The number in parentheses adjacent to the metro area name indicates its ranking among the 36 comparable regions. The value above the bar indicates the number of SBIR/STTR awards given to companies in their respective metro area.

VENTURE CAPITAL

Venture capital (VC) is money invested in new and unproven businesses that helps stimulate growth at the critical early stages of a growing company's development. Many of these new firms require large amounts of external financing for an extended period before they can tap traditional debt or equity markets. The majority of venture investments are follow-on funding that investors place in business sectors where they expect rapid growth.³

Venture capitalists have a history of funding new technologies that are risky investments, but are expected to achieve above-average returns. They become involved as board members and management advisors, suggesting strategic partnerships and helping to refine business plans. Venture capitalists look for high rates of return over a five-year period with an exit strategy of cashing out after a firm becomes publicly traded through an initial public offering or a merger or acquisition by an established firm.

VC activity is an excellent way to gauge investors' confidence in the new ideas and entrepreneurial infrastructure of a region. Those regions with high concentrations of venture capital are seen as having a better entrepreneurial climate.

Venture capital investing dropped precipitously across all comparable regions following the dot.com collapse that began in late 2000. Between 2000 and 2003, VC activity fell collectively in the 36 metro areas from 1,681 deals valued at \$19.3 billion to 719 deals valued at \$4.2 billion. The top five comparable metro areas during this time period were Austin, Denver, Minneapolis, San Diego, and Seattle. In the Cleveland metro area, 27 deals valued at \$316 million were reported in 2000, decreasing to just 16 deals valued at \$33 million in 2003. Out of the 36 metro areas, Cleveland was ranked as high as 15th in total VC investment (2000) to as low as 21st in 2003.

Most observers believe that venture capitalists are more attracted to Pittsburgh-based start-ups than those in Cleveland. Data reported by Thomson Financial confirms this thinking. Between 2000 and 2003, venture capitalists invested \$1.9 billion (199 deals) in the Pittsburgh metro area compared to \$477 million (82 deals) in Cleveland. In fact, Pittsburgh ranked number five in total investment in 2003. This suggests that Pittsburgh-based companies are more innovative in their thinking than their counterparts in Cleveland. According to David Morgenthaler, Morgenthaler Ventures, "VC follows innovations, it does not create them."⁴

³ Follow-on funding refers to monies the entrepreneur taps into after exhausting his/her own financial resources and those of angel investors.

⁴ David T. Morgenthaler's speech to Cuyahoga County Commissioners Blue Ribbon Economic Development Task Force, July 27, 2004.

Figure 2 shows a comparison of total VC investment and number of deals in selected MSAs in 2003. Table B-2 in Appendix B shows VC activity for all metropolitan areas between 2000 and 2003.

INITIAL PUBLIC OFFERING

An initial public offering (IPO) is the sale or distribution of a company's stock to the public for the first time. It indicates strong growth in the company and allows that firm to access public capital markets that provide leverage and accelerate growth. IPOs are also a route to liquidity for entrepreneurs and early investors, such as venture capitalists. The proceeds of going public are typically reinvested in new ideas and opportunities within the firm. IPOs are an important measure of regional innovative climate because they indicate the degree to which an economy is producing companies that investors regard as durable, that is, having long-term and significant growth potential.

A limited amount of activity was reported in the IPO market across all 36 comparable metro areas for the four-year period ending in 2003. The most active year was 2000 with 47 IPOs. A steep decline was seen in 2001 when only 15 IPOs were issued. According to IPO Monitor, 2001 had the weakest deal flow in over 20 years. Reasons cited include the September 11 attack and the fact that investors were no longer interested in putting their money in highly speculative transactions. Investors required a sound business model as opposed to merely an idea or concept. The IPO market picked up slightly by 2003 when 20 companies floated their stock.

There were no IPOs in the Cleveland metro area between 2000 and 2003. In fact, across the entire northeast Ohio region, only one IPO was issued during the four-year period, that by an Akron metro area-based company.⁵ Metro areas reporting the highest number of IPOs included Denver, Minneapolis, San Diego, and Seattle.

Companies issuing IPOs were evenly split among the technology, healthcare, services, and "other" sectors. Technology companies were primarily involved with semiconductors and software. Healthcare included medical devices, biomed, and biotech products. Among service providers were companies involved in communications, food processing, financial products, and education. "Other" sectors included energy, capital goods, utilities, consumer cyclical, basic materials, and transportation.

Figure 3 shows a comparison of the total number of IPOs issued by companies in selected MSAs from 2000 through 2003. Table B-3 in Appendix B provides a summary of IPO activity by sector for all metropolitan areas between 2000 and 2003.

⁵ The International Steel Group (ISG) became a publicly held company on December 12, 2003. After acquiring the steelmaking assets of the bankrupt LTV Corporation, ISG moved the corporate headquarters from downtown Cleveland to Richfield in northern Summit County.

Figure 3. Number of IPOs Issued in Selected MSAs, 2000 – 2003

Notes:

Metro areas represented include those located in the state of Ohio, the five highest ranking, and others in the Great Lakes region.

The number in parentheses adjacent to the metro area name indicates its ranking among the 36 comparable regions. The value above the bar indicates the number of IPOs issued by companies in their respective metro area.

HIGH-TECH EMPLOYMENT

High-tech workers are essential to the creation of economic value. They do more than simply apply technical know-how to firm-specific objectives. Rather, they channel new information to generate new knowledge. By applying analytical skills to complex problems, high-tech workers contribute to the creation of new concepts and processes. Knowledge generation can take the form of incremental innovation in processes as well as radical innovation that propels a business into new products and endeavors.

Which occupations constitute the high-tech workforce? One guiding principal in answering this question states that high-tech workers typically utilize new technologies in performing their work such that the results change the ways in which people live and work. Daniel Hecker's identification of high-tech occupations is gaining broad-based support.⁶ It includes engineers, life and physical scientists, mathematical specialists, engineering and science technicians, computer specialists, and engineering, scientific, and computer managers. These occupation categories served as the basis for data gathering reported here.

The Cleveland metro area reported a decrease in high-tech employment in each year from 2000 through 2003. In 2000, Cleveland reported a 3.7 percent share decreasing to a 3.3 percent share by 2003. In contrast, Akron's high-tech employment share held steady at just under three percent from 2000 through 2001. It then increased to 3.5 percent in 2002 and 2003.

The top five metro areas in high-tech employment (Seattle, Austin, Denver, San Diego, and Minneapolis) also reported decreases in the share of high-tech workers in 2001 and 2002. However, by 2003, these regions reported a small upturn in high-tech employment. Cleveland's share of high-tech employment (3.3 percent) was less than half that reported in Austin (7.5 percent) in 2003.

Figure 4 shows a comparison of high-tech employment share in selected MSAs in 2003. Table B-4 in Appendix B shows high-tech employment share for all metropolitan areas between 2000 and 2003.⁷

⁶ Hecker, Daniel. "High Technology Employment: A Broader View," *Monthly Labor Review*. June 1999, pp. 19-28.

⁷ Figure 4 and Table B-4 only include occupations included in Hecker's definition.

Figure 4. High-Tech Employment Share in Selected MSAs, 2003

Figure 5. High-Tech Employment Share, Including Healthcare Occupations, in Selected MSAs, 2003

Notes:

Healthcare professionals such as doctors and nurses were not included in Hecker's list of high-tech occupations. Although these and other healthcare-related professions are defined as knowledge-intensive, similar to other the high-tech occupations, there is disagreement among analysts as to whether or not their work falls within the guiding principal described earlier that helps define high-tech occupations.

By including healthcare-related occupations as high-tech, 50 percent of the comparable metro areas reported a significant change in their high-tech employment share ranking.⁸ Cleveland's ranking rose from 26th to 19th in 2003. This may be attributable, in part, to research being conducted by doctors and medical technicians at the Cleveland Clinic and University Hospitals. In contrast, Akron's ranking dropped from 20th to 21st. Of the top 10 metro areas (when using Hecker's definition), only two reported a significant rank change: San Diego dropped from 4th (excluding healthcare occupations) to 13th (including healthcare occupations) and Portland dropped from 7th (excluding healthcare occupations) to 15th (including healthcare occupations). Figure 5 shows a comparison of high-tech employment share (including healthcare occupations) in selected MSAs in 2003. Table B-5 in Appendix B shows high-tech employment share (including healthcare occupations) for all metropolitan areas in 2003.

⁸A significant change in rank is defined here as either rising or falling more than three positions.

RESEARCH AND DEVELOPMENT FUNDING

Research and development (R&D) funding is a key driver of economic growth in metropolitan areas. One of the results of R&D is product innovation, which adds to the knowledge base of industry and the marketplace as a whole. Metropolitan areas that have academic institutions performing large amounts of R&D are more able to attract and grow technology-based companies. The R&D infrastructure of a region is critical to building a technology-based economy with newly emerging industry clusters and sustaining the vibrancy of existing clusters.

Two sources of R&D funding are reported in this study: 1) awards presented by the National Institutes of Health (NIH) to colleges and universities, independent hospitals, medical schools, and research institutes, and 2) university-related R&D expenditures from all sources as reported in the Survey of Research and Development Expenditures at Universities and Colleges conducted by the National Science Foundation (NSF). Data collected by the NSF includes NIH grants awarded to universities. Data for private-sector R&D initiatives is not available on the metropolitan level.

In NIH funding, Cleveland ranked fifth out of 36 metro areas in 2001 (latest year of available data). However, the \$227 million awarded to Cleveland area institutions was over \$100 million less than that received by institutions in Pittsburgh and St. Louis, which ranked 3rd and 4th respectively. Cleveland also ranked fifth in the number of NIH awards at 714. In comparison, the top-ranked metro area, San Diego, received 1,567 awards in 2001. However, NIH funding is one measure in which Cleveland ranked higher than Minneapolis. Figure 6 shows a comparison of NIH funding and number of awards in selected MSAs in 2001. Table B-6 in Appendix B provides a summary of NIH funding for all metropolitan areas in 2001.

The Cleveland metro area ranked 10th in overall university-related R&D expenditures in FY 2001 with \$212 million in spending by four institutions.⁹ This is an increase of more than three percent over FY 2000. University-related R&D spending in the top five metro areas (San Diego, Seattle, Austin, Pittsburgh, and Minneapolis) averaged \$537 million in 2001, an increase of 11 percent over 2000. As expected, little change was observed in metro area rankings between 2000 and 2001. Figure 7 shows a comparison of university R&D expenditures in selected MSAs for 2001. Table B-7 in Appendix B provides a summary of university R&D expenditures for all metropolitan areas for 2000 and 2001.

⁹ Colleges and universities in the Cleveland metro area reporting R&D expenditures include Case Western Reserve University, Cleveland State University, John Carroll University, and Oberlin College.

Figure 6. NIH Funding and Number of Awards in Selected MSAs, 2001

Notes:

Metro areas represented include those located in the state of Ohio, the five highest ranking, the five lowest ranking, and others in the Great Lakes region.

The number in parentheses adjacent to the metro area name indicates its ranking among the 36 comparable regions.

The value above the bar indicates NIH funding given to institutions in their respective metro area.

PATENTS

The majority of patents granted by the U.S. Patent and Trademark Office (USPTO) are utility patents.¹⁰ A patent recognizes the viability of a research discovery and sets the stage for possible commercialization. The number of patents issued serves as a proxy for the level of research and innovation in a metropolitan area. A large number of patents indicates the potential for significant product innovation activity and a highly entrepreneurial environment. The capacity of firms to develop new products determines their competitive advantage and ability to pay higher wages.

The Cleveland metro area ranked 8th in the number of utility patents granted over three time periods: 2003, the four-year period from 2000 through 2003, and the 10-year period from 1994 through 2003. Akron ranked 17th with 523 patents granted in 2003. Rankings of the top 12 metro areas remained the same during the three time periods. Looking at two trend periods (2000 through 2003 and 1994 through 2003), the top five metro areas reported approximately twice the number of patents granted as Cleveland.¹¹ However, by 2003, Cleveland began falling further behind the comparable metro areas. In 2003, the top five metro areas were each awarded, on average, 2.5 times the number of patents as those granted in the Cleveland area (2,250 compared to 890). Figure 8 shows a comparison of utility patents granted in selected MSAs in 2003 and during the 1994-2003 time period. Table B-8 in Appendix B provides a summary of patent activity for all metropolitan areas for the time periods discussed above.

In 1996, the Northeast Ohio Clusters project identified six manufacturing-related industry clusters in the combined Cleveland and Akron metropolitan areas.¹² They include metalworking; plastics and chemicals; motor vehicles; biomed; instruments, controls, and electronics (ICE); and information technology (IT). Cleveland's patent ranking in each of the

¹⁰ A utility patent is granted to anyone who invents or discovers any new, useful, and non-obvious process, machine, article of manufacture, or composition of matter, or any new and useful improvement thereof.

¹¹ From 1994 through 2003, the top five metro areas averaged 16,100 patents each compared to 8,400 in Cleveland. From 2000 through 2003, the top five metro areas averaged 8,100 patents each compared to 3,800 in Cleveland.

¹² Industry clusters are important to an economy because they reinforce the competitive position of member industries. When customer and supplier firms locate near one another, they are better able to coordinate the supply chain. More importantly, they can share technical knowledge and workforce skill development that increase performance for all firms in the cluster. Competing firms within an industry are also important because they stimulate innovations such as product improvements, new product development, technology applications, and process improvements that can significantly impact the competitive position of the cluster as a whole. It is the collective nature of the clusters that provides the strategic advantage. In fact, many similar companies are able to differentiate themselves by finding unique market niches that other companies do not fill. Competitiveness through collaboration helps small firms grow, resulting in tangible economic development outcomes for neighborhoods in a local economy.

clusters supports the belief that a significant amount of product innovation activity is occurring within the region in each of these industries. Following is Cleveland's rank (in parentheses) among the 36 comparable regions in the number of patents granted in the cluster industries from 2000 through 2003: metalworking (3), plastics and chemicals (5), motor vehicles (8), biomed (13), ICE (8), and IT (16). Table B-9 in Appendix B provides a summary of utility patents granted by cluster industry for all metropolitan areas.

When looking at the combined Cleveland-Akron metropolitan areas, the number of patents granted in each cluster as a percentage of the cluster total across all 36 comparable regions is especially noteworthy in the metalworking, plastic and chemicals, and motor vehicle industries. The Cleveland-Akron share of all patents in the following categories reveals the significance of these clusters to northeast Ohio: metalworking (10%), plastics and chemicals (13.2%), motor vehicles (11.9%), biomed (2.9%), ICE (5%), and IT (2.1%).

Figure 8. Utility Patents Granted in Selected MSAs, 2003 and 1994 through 2003

Notes:

Metro areas represented include those located in the state of Ohio, the five highest ranking, the five lowest ranking, and others in the Great Lakes region.

The number in parentheses adjacent to the metro area name indicates its ranking among the 36 comparable regions. The value above the bar indicates the number of utility patents granted to inventors in their respective metro area in 2003.

BUSINESS INCUBATORS

Business incubators provide start-up companies with various resources such as physical facilities, office/manufacturing equipment, business assistance services, and management consulting in order to stimulate growth and development during the companies' critical formative stages. The concept of business incubation has been successfully applied across the United States and around the world. Business incubation can offer better returns on investment for successful business creation and job and revenue growth with measurable direct and indirect economic impact.

Greater Cleveland ranked 5th (tied with Cincinnati) with seven business incubators located in the metropolitan area. The top four regions (number of incubators in parentheses) were Minneapolis (14), St. Louis (12), Milwaukee (11), and Pittsburgh (10). The number of incubators is a less important indicator of entrepreneurial activity within a region because of the large turnover in incubator facilities. For example, at the height of the dot.com boom, three incubators opened and closed their doors within a 12-month period in Cleveland's downtown. A far more significant indicator of entrepreneurship would be the number (or percentage) of businesses successfully launched from incubators that are still in operation after one year. However, these statistics are unavailable.

Table B-10 in Appendix B lists the number of incubators in each of the 36 comparable regions. The data provided in Table B-10 does not reflect a specific year. The National Business Incubator Association (provider of the data) maintains an incubator database that is updated upon receipt of new information. Therefore the data in Table B-10 may not accurately reflect the number of incubators in a specific metro area.

CORPORATE HEADQUARTERS

The presence of corporate headquarters (HQ) in a metropolitan area is important to the local economy. The HQ building is home to highly paid executives and staff personnel who add significantly to the local tax base. In addition, the headquarters city is often the base of operations for the firm's high-tech components including engineering and R&D. The existence of corporate headquarters contributes to the stability of regional professional employment, especially in the areas of law, financial services, engineering, and information technology. Finally, large corporations tend to be involved in civic activities and philanthropy.

Headquarter counts in this report are taken exclusively from the *Fortune 500* list. Due to data availability issues, privately held companies and those listed in the bottom half of the *Fortune 1000* are excluded from the analysis. The result being that a somewhat limited picture of headquarters activity across the 36 metro areas is presented in this report.

The Cleveland metro area ranked very high among the comparable regions. In 2000, Cleveland was ranked third (tied with St. Louis) with nine HQs. In 2001, Cleveland reported the second highest number of HQs (tied with Seattle) at nine.¹³ However, by 2002, Cleveland's rank dropped to number four (tied with Charlotte and Milwaukee) with eight corporate headquarters.¹⁴ In 2003, Cleveland still retained six Fortune 500 headquarters, but its ranking dropped to number eight.¹⁵ Akron reported two corporate headquarters in 2000 and 2001 and three in 2002 and 2003.¹⁶

Among the 36 metro areas, Minneapolis is dominant. It reported significantly more Fortune 500 HQs than any other metro area between 2000 and 2003. Of the 500 largest publicly held companies (by revenue) in the United States, only 28 percent are headquartered in metro areas considered in this report. Figure 9 shows a comparison of corporate headquarters located in selected MSAs for 2003. Table B-11 in Appendix B provides a summary of headquarter counts for all metropolitan areas between 2000 and 2003.

¹³Cleveland area headquarters in 2001: Eaton Corp., KeyCorp, LTV Steel, National City Corp., Office Max, Parker Hannifin, Progressive Insurance, Sherwin-Williams, and TRW.

¹⁴Cleveland area headquarters in 2002: Eaton Corp., KeyCorp, National City Corp., Office Max, Parker Hannifin, OM Group, Progressive Insurance, and Sherwin-Williams.

¹⁵Cleveland area headquarters in 2003: Eaton Corp., KeyCorp, National City Corp., Parker Hannifin, Progressive Insurance, and Sherwin-Williams.

¹⁶Akron area headquarters in 2003: First Energy, Goodyear, and International Steel Group.

Figure 9. Number of Fortune 500 Corporate Headquarters in Selected MSAs, 2003

Notes:

Metro areas represented include those located in the state of Ohio, the five highest ranking, the lowest ranking, and others in the Great Lakers region.

The number in parentheses adjacent to the metro area name indicates its ranking among the 36 comparable regions. The value above the bar indicates the number of Fortune 500 corporate headquarters located in their respective metro area.

BUSINESS COSTS

This report utilizes the *North American Business Cost Review* (NABCR), produced by Economy.com, as the basis for comparing the 36 metropolitan areas. NABCR's total business cost index is derived from four components: labor, energy, state and local taxes, and office rent. The U.S. index equals 100 for total cost and each of the four components. For a specific metropolitan area, if any of its indices is greater than 100, then the total cost, or component cost, is greater than the U.S. average. If an index is less than 100, then the total cost, or component cost, is less than the U.S. average. As an example, the office rent index for the Cleveland metropolitan area is 87.9. This means that office rent in the Cleveland area is about 12 percent less than the U.S. average.

This indicator is an important measure of a regional business climate because companies in a lower business cost region are more competitive than companies in a higher business cost region if everything else is equal between the two regions. The data reveals that the Cleveland metro area (and the entire northeast Ohio (NEO) region) is a high cost place to do business. Cleveland ranks 30th (index = 105.2) in total business cost; only six other comparable metro areas report higher business costs than Cleveland. The highest cost metropolitan areas are all in California: San Diego, Riverside, and Sacramento. In NEO, Akron ranks 27th, Youngstown ranks 26th, and Canton ranks 21st.

The primary reason for the high rankings is the cost of energy. Cleveland's energy index equals 132.9. The other metro areas in NEO report an energy index of 129.1. These are in contrast to the lowest energy cost metro areas: Portland, OR (75.0); Louisville, KY (75.2); Virginia Beach, VA (80.0); Richmond, VA (80.0); and Denver, CO (81.5).

In addition to energy, taxes contribute significantly to the high cost of doing business. Following are the tax indices for NEO: Cleveland (111.9), Akron (110.7), Canton (106.2), and Youngstown (106.3). Figure 10 shows a comparison of the total business cost index and the energy index in selected MSAs for 2002. Table B-12 in Appendix B provides a listing of the total business cost index as well as labor, energy, taxes, and office rent sub-indices for all metropolitan areas in 2002.

Figure 10. Total Cost of Doing Business Index and Energy Index in Selected MSAs, 2002

Notes:

Metro areas represented include those located in the state of Ohio, the five highest ranking, the five lowest ranking, and others in the Great Lakes region.
 The number in parentheses adjacent to the metro area name indicates its ranking among the 36 comparable regions.
 The value above the bar indicates the metro area's total cost of doing business index.

APPENDIX C – BUSINESS AND INNOVATION CLIMATE INDEX

CREATING THE INDEX

The business and innovation climate index is simply a summary measure based on a large number of variables. The methodology used to create the index is based on models found in the *Metro Area and State Competitiveness Report* and a paper entitled: *Have Central Cities Come Back?*¹⁷ The most difficult and often controversial part in creating an index is choosing a weighting scheme. The approach taken here is the simplest and most transparent: within each sub-index, each variable carries equal weight.

The aggregated (overall) index is constructed using seven sub-indices, which were created using 14 economic variables (see table C-1, Appendix C for details). Given the raw data series for each metro area, several steps were needed to construct the index:

Step 1: Each variable was standardized using a median-score. The median score is analogous to the familiar z-score, but it uses a set of measures that are less susceptible to the influence of outliers than z-scores. In addition, median-scores are an alternative to z-scores for index creation when the variables used have highly skewed distributions.

Step 2: The seven sub-indices were formed as the simple averages of the standardized component variables.

Step 3: Each sub-index was then scaled to give it a range from one (worst) to 10 (best).

Step 4: The aggregated (overall) index was formed as the simple average of the seven sub-indices.

APPENDIX D: COMPARABLE METRO AREA IDENTIFICATION CRITERIA

The comparable metropolitan areas included in this report are similar in size to the Cleveland metropolitan statistical area (MSA) and meet at least one additional criterion: structure, location, or growth.

- *Size:* Metropolitan areas must be within one standard deviation of the Cleveland MSA in population or labor force.
- *Structure:* Metropolitan areas whose percentage of the labor force are within one standard deviation of the Cleveland PMSA in each of the following categories: occupations that are related to sales and office support functions; managerial and professional occupations; and employment in industries that comprise the manufacturing sector.¹⁸
- *Location:* Metropolitan areas that are located in the Midwestern states including North Dakota (ND), South Dakota (SD), Nebraska (NE), Kansas (KS), Minnesota (MN), Iowa (IA), Missouri (MO), Wisconsin (WI), Illinois (IL), Michigan (MI), Indiana (IN), and Ohio (OH).
- *Growth:* Fastest growing metropolitan areas in the United States by actual growth in the labor force or percentage growth in the labor force between June 1997 and June 2002. Data source: Bureau of Labor Statistics.

¹⁸Professional occupations include those in areas such as law, engineering, accounting, and information technology.
