DRUGHELP.CARE – A WEB APPLICATION FOR THE DISCOVERY OF DRUG
ADDICTION TREATMENT FACILITIES

SACHIN HIRIYANNA

Bachelor of Technology in Information Technology

Vellore Institute of Technology

June 2016

Submitted in partial fulfilment of requirements towards the degree of

Master of Science in Software Engineering

at the

Department of Electrical Engineering & Computer Science

CLEVELAND STATE UNIVERSITY

May 2018

We hereby approve this thesis for

SACHIN HIRIYANNA

Candidate for the Master of Science in Software Engineering degree for the

Department of Electrical Engineering and Computer Science

and the CLEVELAND STATE UNIVERSITY'S

College of Graduate Studies by

Committee Chairperson, Dr. Wenbing Zhao

Department of Electrical and Computer Science & Date

Committee Member, Dr. Lili Dong

Department of Electrical and Computer Science & Date

Committee Member, Dr. Yongjian Fu

Department of Electrical and Computer Science & Date

Student's Date of Defense: 05/07/2018

ACKNOWLEDGEMENT

I would like to express the deepest appreciation to my mentor and advisor, professor Dr. Wenbing Zhao, for continually helping me through this research and development. He has not only supported me technically but also morally by providing me with constant appreciation and confidence in what I'm doing and also by providing me with space and resources in his own laboratory. Without his guidance, support and invaluable advice this thesis would not have been possible. I will always admire his persistence and commitment towards technology and innovation.

I would like to thank my committee members Dr. Lili Dong whose work demonstrated to me that concern for Advanced Control Systems and Dr. Yongjian Fu whose tremendous researches are related to Web Technologies and Data Mining.

I would like to thank my family, especially my father, mother and sister for their unconditional love and trust in me. And for standing by and supporting me all the time both morally and financially to finish this course of study and research.

And finally to all my friends and relatives for having the faith in me and upholding the friendship all the time.

DRUGHELP.CARE – A WEB APPLICATION FOR THE DISCOVERY OF DRUG
ADDICTION TREATMENT FACILITIES

SACHIN HIRIYANNA

ABSTRACT

One of the current and biggest problems in the system of emergency care for the drug overdose epidemic, is the failure of information delivery on nearby treatment facilities. Even though some initiatives on the internet tried to solve this issue, they either failed in delivering the information or in providing ease of usability. This thesis research aims to develop a web application which,

1. Delivers a highly accurate, easy-to-understand and targeted information in a timely manner for drug abusers and their well-wishers.
2. Provides an eco-system for the treatment facilities with an easy-to-use backend to constantly update their complex information along with automatic email reminders and data completion progress indicators.

In the first step of this thesis, a study was carried out on efficiency and ease of access to information by the drug abusers and by their well-wishers on nearby treatment facilities. In the second step, another study carried out in order to find out the ease of information delivery by treatment facilities about themselves. Finally, based on the established truth, a front and back-end of the web application are designed, developed using LAMP stack, deployed and tested. A search engine for the drug abusers and their well-wishers preserves the complete anonymity, which is very important to hide the identities of the drug abusers.

ACRONYM

- a. CSS – Cascading Style Sheets
- b. SMTP – Simple Mail Transfer Protocol
- c. FK – Foreign Key
- d. LAMP – Linux + Apache + MySQL + PHP (A development stack)
- e. PHP – PHP Server side scripting language
- f. MySQL – Database query Language
- g. SFTP – Secured File Transfer Protocol
- h. WWW – World Wide Web

CHAPTER I

THE STUDY

1.1. Motivation

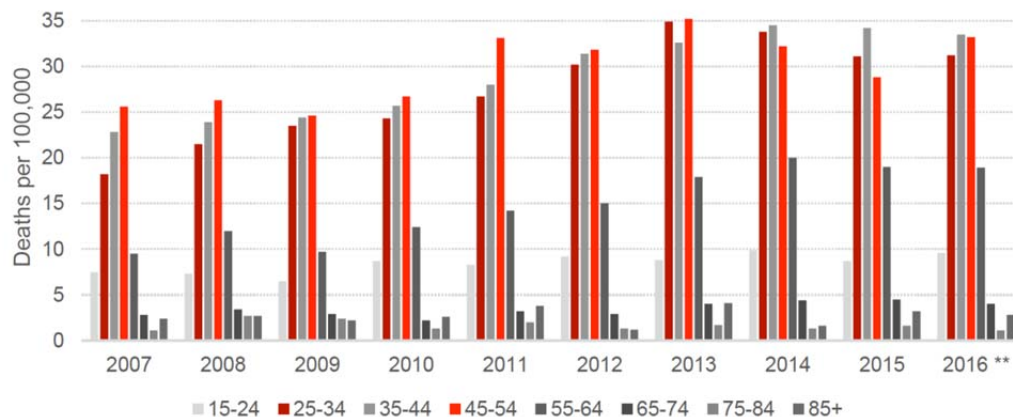

More than 64,000 Americans lost their lives from drug overdoses in 2016 alone [1], and this number is increasing. Most of these lives could have been saved if either the victim or their friends or family members acted quickly to reach out to treatment facilities in a timely manner. The real problem lies in the fact that these treatment facilities are either non discoverable or not relevant. For example, some treatment facilities do not accept pregnant ladies and most of time this information is not known to the people unless they get to the facility physically.

There are several web apps that offer a searchable list of treatment facilities, however they lack in providing accurate information or updated information like information on availability, waitlist or any other service specific information.

Thus, it is much required to develop the web application which is having the data that is trustable and is updated dynamically by the treatment facilities themselves.

1.2 Study on Drug Abusers

In the state of Ohio, drug addiction, abuse, and overdose deaths is the most disastrous health issue. And the state of Ohio is the leader in the country for the drug overdose deaths per capita, and the rates are continuously rising, devastating the lives within families, communities, and also local governing bodies across the state of Ohio. Figure 2 shows the overdose deaths rates by age in the state of Ohio from 2007 to 2016 (Incomplete year). As we can analyze the trend, the rates are just increasing and it is very sad to know there are only a few initiatives actually doing something useful to help the drug addicts.

SOURCE: Ohio Public Health Data Warehouse

Figure 1: Ohio Overdose Death Rates by Age

1.2.1 The Problems: Although there are a few initiatives who are trying to help drug abusers, the following are the problems that are facing by the end-users.

- The drug abuser wouldn't know the admission policies and whether or not the treatment facility would accept their condition. Ex: Treatment Center X doesn't admit any patients who are pregnant.
- The drug abuser wouldn't know the availability or waitlist of a particular treatment or service unless and until they make a phone call to every facility they are interested in.
- The drug abuser is very confused to navigate and look around the website since the design is very cluttered and maybe filled with ads or useless web components.
- Unable to get responsive and clean website on mobile phone or tablet.

1.2.2 The Solutions: To address the above mentioned problems, the following features are considered to develop within the web application as preferred solutions.

- To show the availability and waitlist for admission dynamically.
- To show the constraints or restriction for admission to particular treatment or service.
- To provide accurate information, verified and updated by treatment facilities themselves.
- To provide quick access buttons like call, directions or website.
- To provide clean web design to help intoxicated person to get help without any confusion.
- To provide options to filter and sort the list of treatment facilities based on various attributes including availability and waitlist.
- To provide responsive design which even supports mobile devices.

1.3 Study on Treatment Facilities (Agencies)

Although treatment facilities are willing provide real-time data on availability, waitlist and admission policies, it is unfortunate that nobody has developed a web application which will let them deliver that to the potential customers.

1.3.1 The Problem: The following points are the problems that treatment facilities currently have, that needs to be addressed to help drug abusers obtain trustable information on them.

- No dashboard or admin panel developed for the treatment facilities to administer their data.
- No option on the existing discovery platforms for the treatment facility to update their availability and waitlist for each and every drug related treatment services.
- No option to visualize the data entry progress for every service they register.
- No option for them to add contact persons to get scheduled reminders to update the data on treatment services.
- No option to register a treatment service with multiple time or location based sub-services.

1.3.2 The Solution: To address the above mentioned problems, the following features are considered to develop within the web application as preferred solutions for treatment facilities.

- To develop a dashboard for administrators.
- To provide option to resister, update and delete a service.

- To provide option to register multiple sub-services under a service based on location and hours of operation.
- To provide option to add multiple contact persons to a particular service.
- To send email reminders to constantly update the availability and waitlist of the treatment services.
- To show data entry progress indicator for every service they have registered.

1.4 Related Work

EmeraldJennyfoundation.com [2] was founded last year to solve the challenge of discovery of drug abusers treatment facility, it has the search feature that has filters for outpatient, residential and Medication Assisted Treatment options [3]. But this platform also has most of the problems that are listed above including failure to provide availability and waitlist information.

1.5 Web Application Development

Users tends to uninstall the mobile app at some point of time because of limited resources on a mobile device like storage space, battery life etc. [3]. Now by taking advantages of a good and efficient CSS Framework on our web application, we can deliver them with best experience possible on whatever the device they are accessing it on without having them to download or install an app. Because of these reasons, it decided that the best option to develop is a web application but not a mobile application.

1.5.1 Bootstrap: Bootstrap [4] is the most used and advanced CSS Framework to build Web applications. It not only is easy to learn and implement but is also very efficient in terms of the responsiveness of web components on various devices with different screen sizes. Hence we can take advantages of these features to build web application which works seamlessly on the mobile phone or tablet's browser without having to reach out to a browser on computer by the user.

Bootstrap follows the twelve column Grid system [5] and a series of containers, rows, and columns to layout and align the contents. It is built using flexbox [6] and is fully responsive to every screen sizes.

Below figure shows the supportiveness of Bootstrap version 4 on browsers of various mobile devices [7].

	Chrome	Firefox	Safari	Android Browser & WebView	Microsoft Edge

CHAPTER II

REQUIREMENTS SPECIFICATIONS

Usually, the requirements in any software development lifecycle is broadly classified into two main details; system and user requirements, where in this project, software development engineers need more technical specification on the web application whereas the end-users i.e. drug addicts and treatment facilities needs more of a high-level statements of specifications on the web application. [4]

2.1 System Requirements

The system requirements specifications mean more technically detailed description of the web application to be built and the operational conditions as to how it is going to be used, and development constrains like what programming languages to use, which server or database to use and also what architectural pattern to follow. Having the systems requirement ready is a crucial part to make sure the future software developers will get the clear picture as to what exactly to do to maintain the web application. Each sub-heading under this paragraph will give the detailed system requirements for the web application.

2.1.1 Application Development:

- 1. Front-end development:** DrugHelp.Care web application front end may require constant design changes based on the feedback we get from the drug abusers. For this reason, it is important to use a CSS Framework which provides us the flexibility to reuse components and modify the design of entire application from a single file.
- 2. Back-end development:** It is very important for us to build the application that is scalable and is easy to maintain. For this reason, we have to choose a development stack that is widely used and has good support on the internet.

2.1.2 Web Hosting:

- 1. Web Server:** Since the web application deals with huge amount of data with complex database transaction and queries, it is required to choose a server that can handle good amount of computation and can handle the load when hundreds or thousands of user access the app concurrently. For this reason, it is wise to choose a server that is auto-scaling, load-balancing and has the option to pay as per the usage.
- 2. Email Server:** We need an email server that supports SMTP and message encryption techniques. And to avoid using blacklisted servers accidentally from third parties, it is always good to create a brand new instance of email server which gives us the confidence that the email will not end up in spam folders.

3. **Database:** It is important to choose a relational database which offers all the advanced features of query language like constraints, joins etc. also the one which provide the user interface to visualize the data in schema.

2.2 User Requirements

The main end-users of the web application are drug abusers, their friends or families and treatment facility administrators.

2.2.1 Drug abusers: Since the drug abusers will have short window of memory when they are intoxicated, the look and feel of the treatment search page needs to have clean and comfortable user interface design. The following are the design characteristics to consider while designing the user interfaces.

1. Minimal use of colors
2. Use of non-flashy colors
3. Loosely placed UI components
4. Enough room to perform mouse click
5. Less or zero auto changing contents
6. Easy navigation between components
7. Collapsible components to hide unwanted text
8. Highlighting the important buttons

2.2.2 Treatment Facilities: The treatment facilities will be dealing with inputting a massive amount of data as a process of signing up to the web application. For each of the treatment services and sub-services they are offering, they need to input the details accordingly, maintain and track the progress of data entry. Since the whole application depends on the accuracy and data completion progress by the treatment facilities, it is required to design efficient user interfaces to help treatment facilities understand each step of the signup. The following points briefly summarize the expected and mandatory characteristics of Treatment Facilities' part of the application.

1. To easily register one or more services at a time.
2. To easily understand the complete flow of registration.
3. To show bird's eye view of huge dataset of services to select from.
4. To provide data completion progress indicators.
5. To provide feedback on every important steps.
6. To remind the contact persons to update the information periodically.
7. To provide easy and efficient interface to contact persons.
8. To easily manage and update each service details.
9. To easily navigate between the services.
10. To provide high security on the data that they are entering.
11. To secure the administrators account with authentication techniques.
12. To provide email notifications when an account information changes.
13. To provide all the utilities to completely authorize a contact person for a service.
14. To secure administrator's account from hacking by computer bots.

CHAPTER III

SOFTWARE DESIGN AND PLANNING

Software design is a process of translating or visualizing the user requirements, which will help the software developer to clearly understand the exact needs of end-users. Whereas software planning is the process of planning the development of software application completely by defining the time and cost of the Software application. Figure 3 shows the base architecture of the web application.

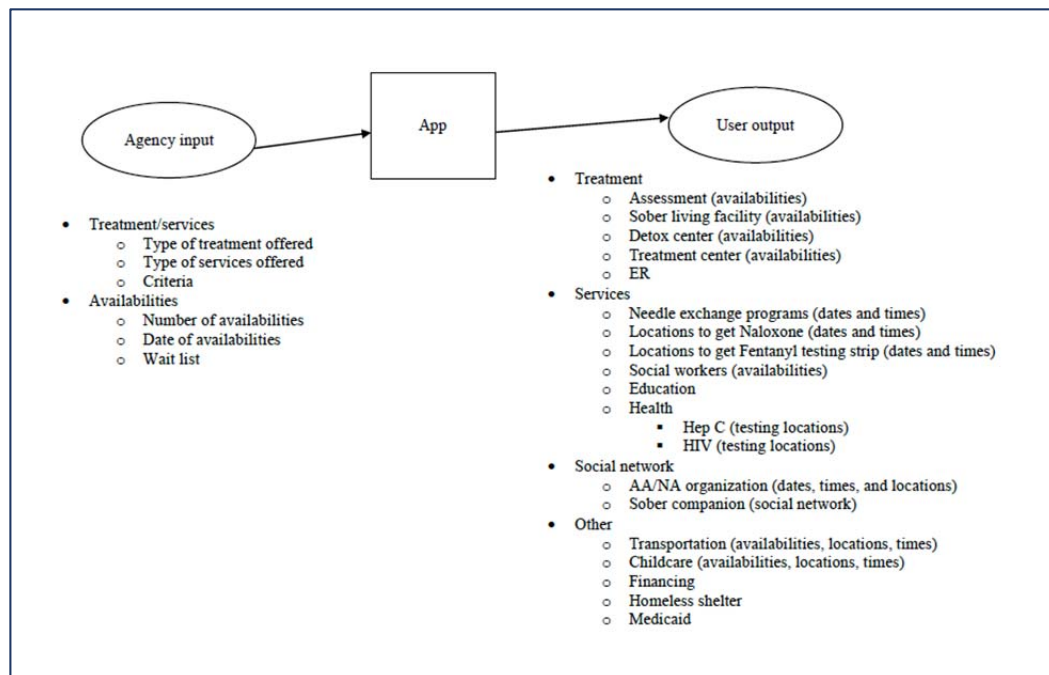

Figure 3: Base Architecture

3.1 User Interface Design

User interface is the frontend part of the application where the end-users can perform interactions with the backend through GUI components like buttons, text field etc. In this web application, drug abusers being one of the end-user, requires us to design the UI very carefully with clean design and properly placed web components.

3.1.1 User Stories and brainstorming: As per the requirements, we need to create user stories and brainstorm among the stake holders on a whiteboard to verify the correctness and usability before proceeding to the development of the front-end. Figure 4 shows the brainstorming of user stories on a whiteboard. This step very important as during the process of brainstorming, we will come across all the web UI components that we need to use during development. This helps us to think about challenges that may arise during the development.

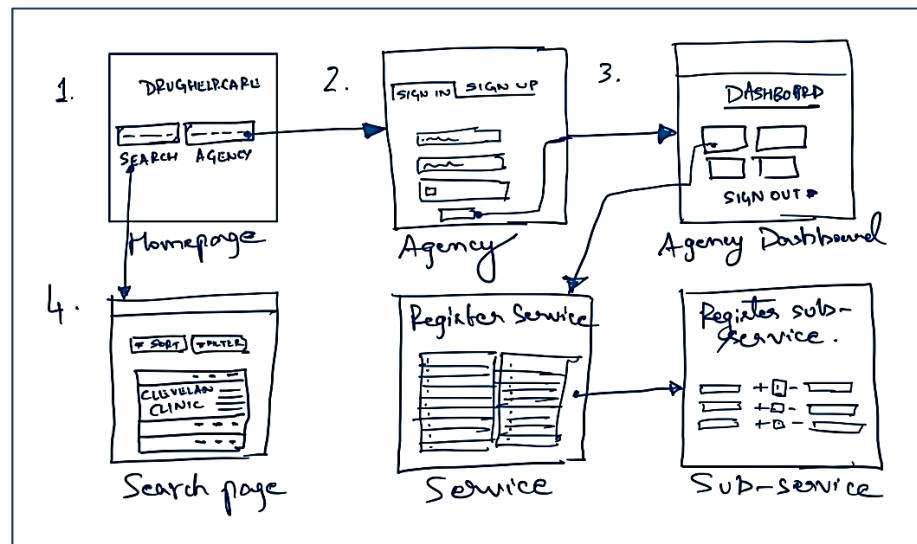

Figure 4: User stories and brainstorming on a whiteboard

3.1.2 Use of Accordion: Accordion is a web component that extends the Cards container [9] of Bootstrap in which organizes content within collapsible items. Accordion provides us the better way to manage the web view area, by allowing us to expand only one collapsible item at a time.

Figure 5 shows a simple example of the use of accordion using Bootstrap CSS Framework.

☐ Referral ▼

☒ Assessment ▼ **REGISTERED**

☒ for IOP **REGISTERED**

☒ for Detox **REGISTERED**

☐ for Other

☐ Walk-in assessment ▼

Figure 5: Use of Accordion

Working: When ‘Assessment’ tab is expanded with its children, every other i.e. ‘Referral’ and ‘Walk-in assessment’ tabs will have the children collapsed and hidden. This enables the better management of web area.

3.2 Database Design

Figure 6 shows the relationship model of database for the web application. The Registered Service table, Contact Person table and Password Reset table has a foreign key on Agency table. Whereas the Dataset table has a FK on Registered Service Offering table which in turn has FK on Registered Service table.

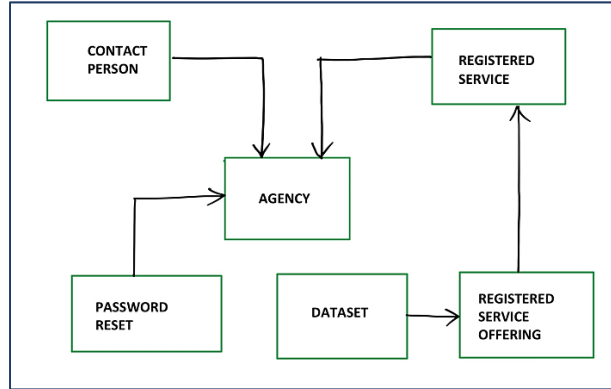

Figure 6: Database Relationship Model

3.2.1 Tables:

1. AGENCY TABLE: This table is used to store account information of Agencies.

Figure 7 shows all the columns and data types. Figure 8 shows the Indexes of the Agency table.

#	Name	Type

CHAPTER IV

SOFTWARE DEVELOPMENT

Software development is the process of implementing the web application based on user and system requirements.

4.1 Environment Setup

The following tools will be used to develop the web application.

1. Atom IDE, will be used as an editor and debugger.
2. CyberDuck SFTP, will be used to transfer files to and from the server to the local computer.
3. DataGrip, will be used as database client to visualize the schema.
4. PHPMyAdmin, is used to access production database on the server through HTTP.

4.2 Version Control using Git

A Version control system is a tool that allows us to track the iterative changes we make to our code base. It is an important tool for any software developer because it allows us to revert back to previous version of the code base anytime when required and also allows us to let more developers collaborate towards the app development. Moreover, we

can have different branches of the repository with different versions of code base, this enables us to compare and differentiate between the code base of different versions.

Figure 23 shows the preview all my contributions towards the development web app on a most popular version control software called GitHub.

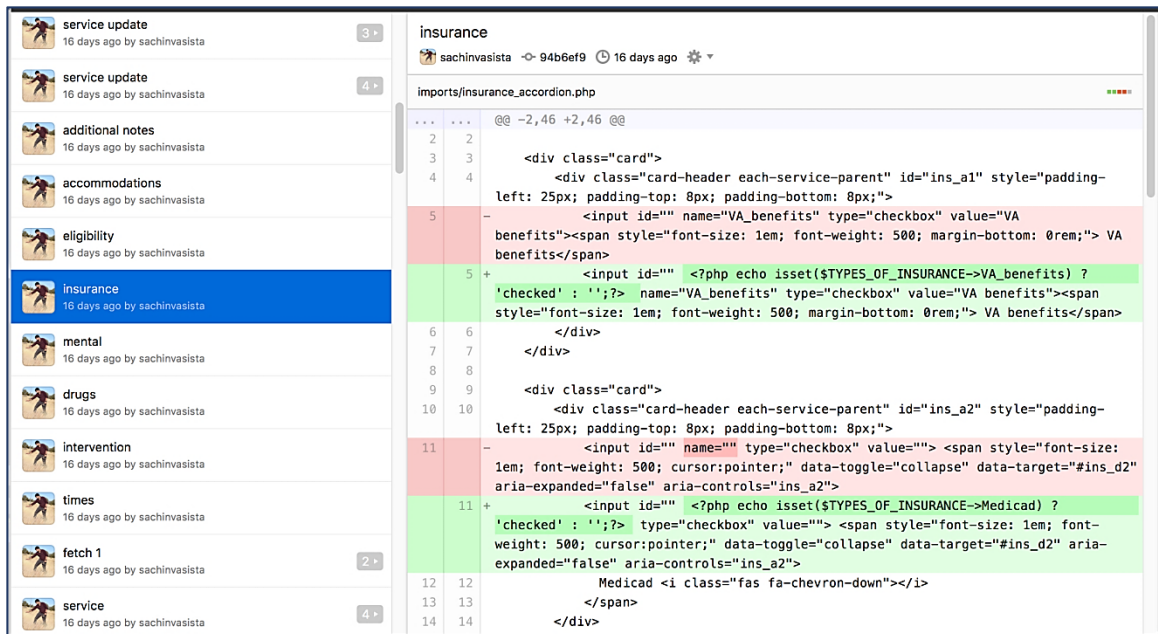

Figure 23: GitHub desktop tool

Figure 24 shows a graph generated by GitHub for my contributions towards web app development in Line of code over time.

Figure 24: My Contributions in Line of Code

4.3 Implementation

Each of the following heading showcases the screenshot of the live web application and their features and functionalities.

4.3.1 Homepage – *www.drughelp.care*: Figure 25 is the screenshot of web application’s homepage. It has two main buttons, one for drug abusers and another for agencies. As we can see it the design is clean and clear and to the point. It is not cluttered and it is not confusing.

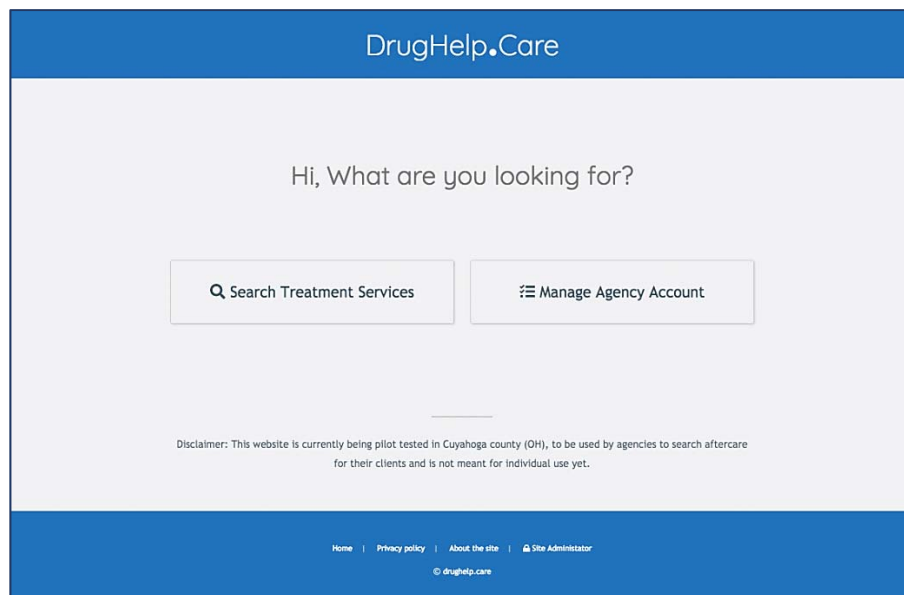

Figure 25: Homepage

4.3.2 Search Page: Search page is used by the drug abusers, their friends or family members. They can look for emergency care or treatment facilities in a timely manner with accurate and updated information. Figure 26 shows the screenshot of a search page, as we can see the space is intelligently managed by using accordion and collapsible cards and all the important buttons like call, web and map are highlighted and placed on top.

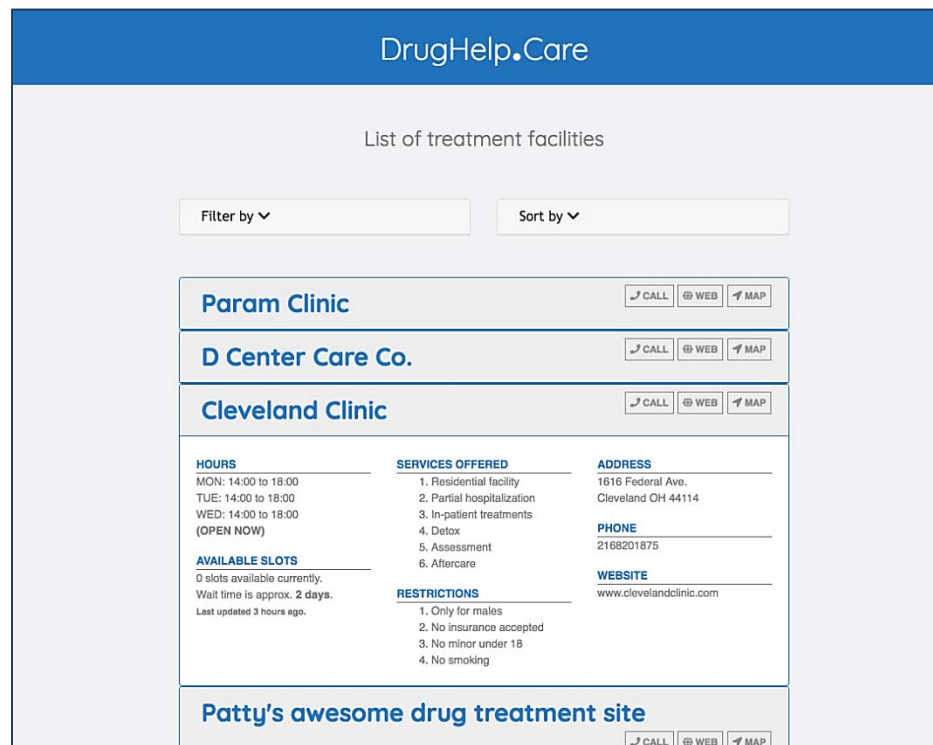

Figure 26: Search page

Figure 27 shows the screenshot of all the sorting and filtering options that a user can select from while looking for the facility.

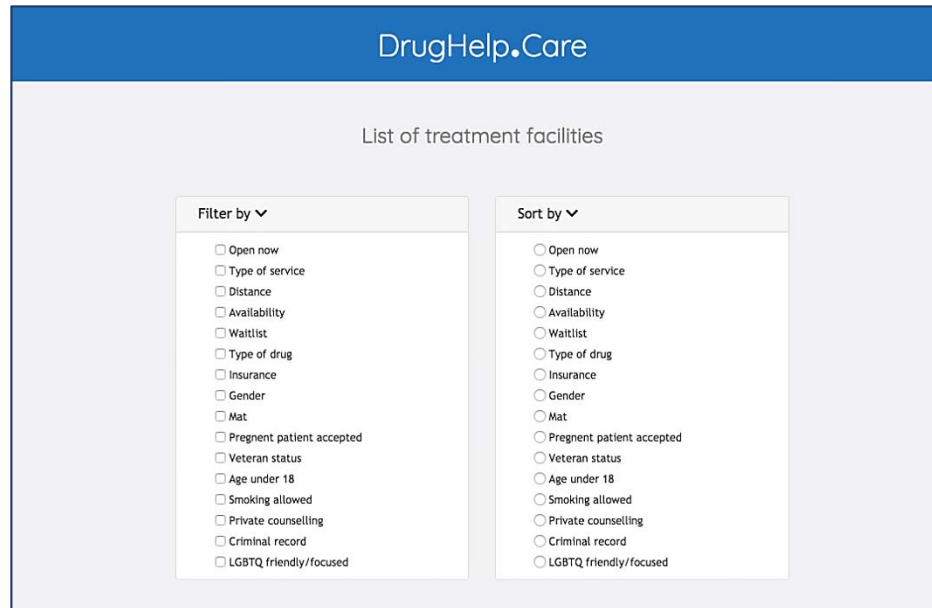

Figure 27: Search page's sorting and filtering options

4.3.3 Treatment facility – Account Signup: Agencies, also called as Treatment facilities will have an administrator who will sign-up by providing all the contact and location information including administrator's email id. Figure 28 shows the screenshot of the signup page for the Agencies.

Figure 29 is the screenshot of an email that is sent to administrator's inbox for the purpose of Email verification. This email will have a unique link generated by the backend.

Figure 30 is the page that opens when administrators click on the unique link. It shows a special checkbox, which ensures that the verification operation is being done by a human but not a software bot.

The screenshot shows the 'Create an Agency Account' page on the DrugHelp.Care website. The page has a blue header with the logo. Below the header, the title 'Create an Agency Account' is centered, followed by a link to 'Sign In' for existing users. The form is divided into several sections with labels and input fields:

- Agency Name:** A text field with a building icon and placeholder text 'Full Name of Agency'.
- Agency Website:** A text field with 'http://' and a placeholder 'Website Homepage'.
- Main Address:** A text field with a building icon and placeholder 'Building, Unit# and Street'.
- City:** A text field with a globe icon and placeholder 'Cleveland'.
- State:** A dropdown menu with 'OH' selected.
- Zip code:** A text field with a hash icon and placeholder '5 digit zip code'.
- Main Phone Number:** A text field with a phone icon and placeholder '10 digit phone number'.
- Agency Administrator Email:** A text field with an '@' icon and placeholder 'someone@company.com'.
- Confirm Email:** A text field with an '@' icon and placeholder 'someone@company.com'.
- Password:** A text field with a key icon and placeholder 'Enter strong password'.
- Confirm Password:** A text field with a key icon and placeholder 'Re-enter the password'.

Below the form fields, there is a note: 'NOTE: Password must contain at least a number, an uppercase and a lowercase letters, with at least 8 or more characters.' and a checkbox with the text: 'By registering this agency, I am agreeing to drughelp.care's terms and conditions and privacy policy.' At the bottom right, there is a green button labeled 'SAVE & CONTINUE' with a right arrow icon.

Figure 28: Agency Account Creation

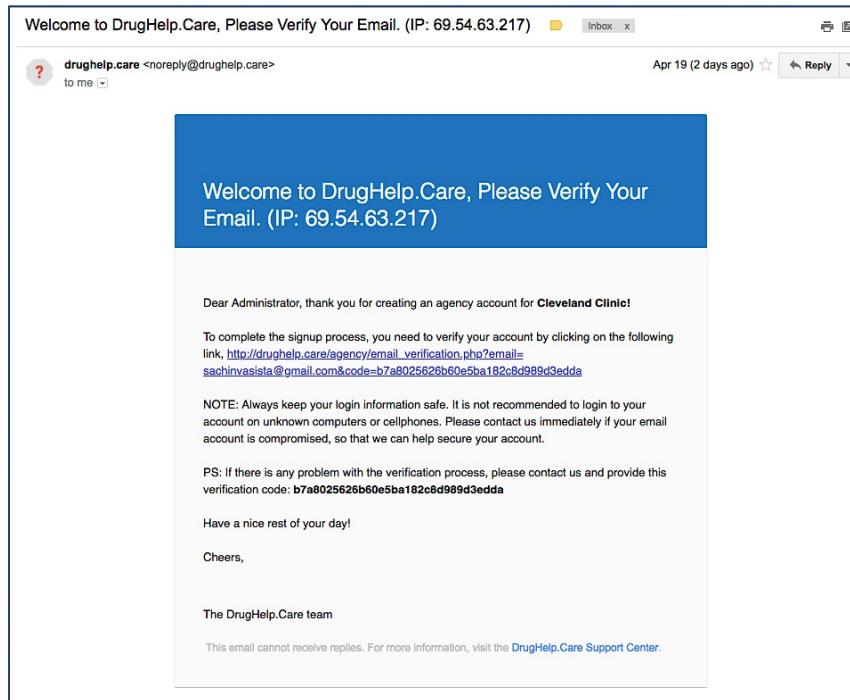

Figure 29: Agency Email Verification

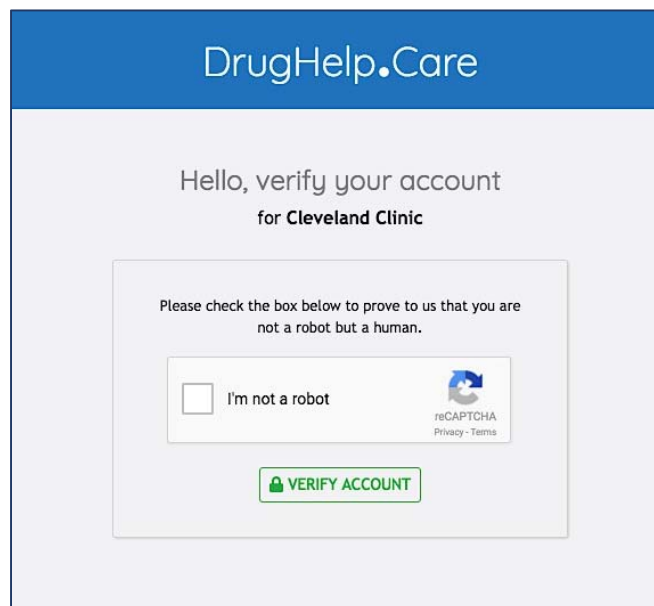

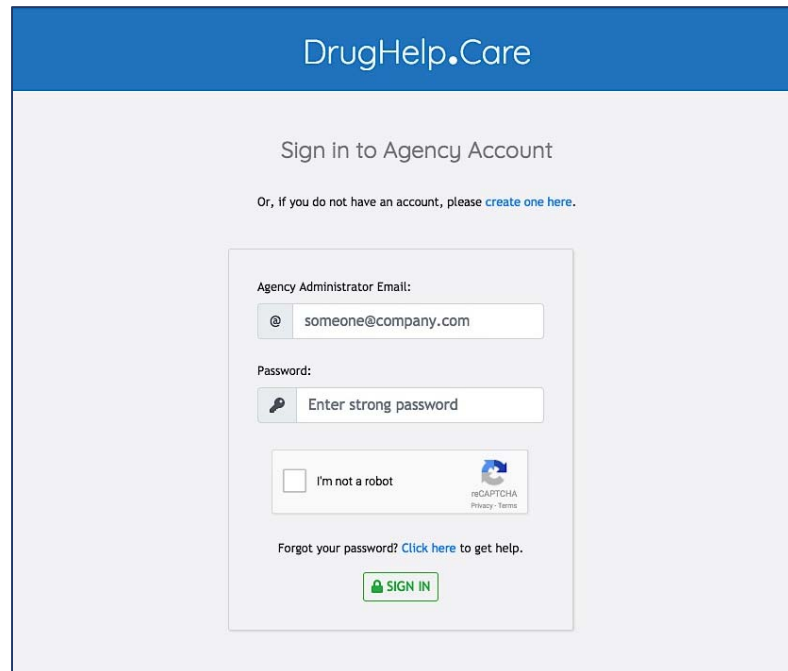

Figure 30: Agency Email Verification Action

4.3.3 Treatment facility – Account Sign-in and Password Reset: Figure 31

shows the screenshot of Agency’s account sign in page. It shows a special checkbox, which ensures that the operation is being done by a human but not a software bot. The password is masked by bullets for privacy while the user typing it.

Figure 32 shows Reset Password page, where agency admins can request for a unique link to reset the password.

Figure 33 shows the email with a unique link to Reset the password, sent to agency admin’s inbox.

The screenshot displays the 'DrugHelp.Care' sign-in interface. At the top, a blue header contains the logo. Below it, the text 'Sign in to Agency Account' is centered, followed by a link to 'create one here' for new users. The main sign-in area is a light gray box containing: an email input field with a placeholder '@ someone@company.com'; a password input field with a key icon and the text 'Enter strong password'; a reCAPTCHA checkbox labeled 'I'm not a robot'; and a 'SIGN IN' button with a green lock icon. A 'Forgot your password?' link is positioned above the button.

Figure 31: Agency Sign-in page

Figure 32: Agency account - Reset password page

Figure 33: Agency reset password email

4.3.4 Treatment facility – Dashboard: Figure 34: Shows Agency’s Dashboard, and it is simple and straight forward.

Figure 35: Shows the service registration page where admin can select one or more services and sub services and continue with registration.

Figure 36: Shows the service offering registration page where admin will add one or more offering for each service based on time or location.

Figure 37: Shows all the registered services with a data completion progress indicator for each of the services.

Figure 38: Shows a page where details can be entered for each service.

Figure 39: Shows a screenshot of how a modal form looks like in the process of data entry.

CHAPTER V

CONCLUSION

In this thesis, we developed a web application that is used by drug abusers and treatment facilities. The major contributions of this thesis include:

1. We carried out a study on drug abusers and treatment facilities and understood the existing problems faced by each of them.
2. We listed the user and system requirements based on the existing problems.
3. We designed and planned the web application, including UI and database.
4. We developed the web application using Bootstrap CSS Framework and PHP in the backend with MySQL database and tested for the responsiveness on mobile devices.

Figure 43 shows the actual screenshots of web application on mobile device.

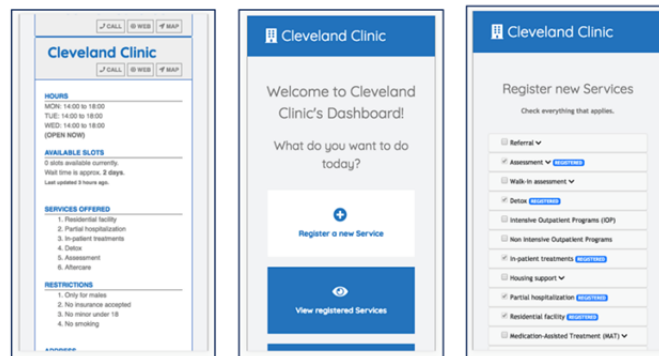

Figure 43: Screenshots of web application on Mobile phone
