This Presentation is brought to you for free and open access by the Maxine Goodman Levin College of Urban Affairs at EngagedScholarship@CSU. It has been accepted for inclusion in Urban Publications by an authorized administrator of EngagedScholarship@CSU. For more information, please contact library.es@csuohio.edu.
Climate Change, Infrastructure, Economies and Governance in the Great Lakes Basin

April 21 & 22, 2016
Levin College of Urban Affairs
Cleveland State University
Wendy A. Kellogg, Conference Chair
Purpose of the Conference

- Make connections
- Connect conversations of Great Lakes and urban water professionals to urban sustainability managers and planners
- Explore innovative water management frameworks and practices to prepare for climate change
- Deepen our understanding of interdependencies among water infrastructure, economies and governance
- Identify climate vulnerabilities and response assets and opportunities in the legacy cities of the Great Lakes basin
Who is Here?

• ~140 people registered

• Vermont, New York, Ohio, Indiana, Michigan, Illinois, Wisconsin, Maryland, Virginia, Massachusetts, North Carolina, Kansas

• City, county and MPO planning departments, engineering consulting firms, planning and landscape architecture firms, water technology companies, recreation industry, regional sewer districts, city water departments, watershed and basin-wide NGOs, policy and research centers, elected officials, Sea Grant extension agents, law firms, universities, state and federal agencies, port authorities, funding entities and foundations!
The Resilience Framework

• Capacity of a social-ecological system to absorb or withstand perturbations and other stressors ...to maintain its structure and functions....the degree to which the system is capable of self-organization, learning and adaptation.

• Ability of assets or systems to anticipate, absorb, adapt and/or rapidly recover from a disruption event
  • H. Brown, 2014
Social-Ecological Systems

- Complex, adaptive, co-evolving in reciprocal relationships
- Cities co-evolve with surrounding landscape and waterscape
- Lakes evolve in response to human activities, including cities
- Great Lakes cities different than others

- **Nestedness**: system components may be subsystems with components of their own
- **Adaptiveness**: constant reorganization to maximize resource and energy efficiency
- **Nonlinearity**: manipulation may result in an outcome of unexpected magnitude
- **Emergence**: properties or behavior may only be explainable by the sum of dynamics at a higher level

Urban Resilience

Great Lakes Ecosystem

- Metabolic Flows: Production, supply and consumption chains
- Governance Networks: Institutional structures and organisations

Great Lakes Cities

- Social Dynamics: Demographics, human capital and inequity
- Built Environment: Ecosystem services in urban landscapes

Civic Explorer, 2016

Plenary

• Elizabeth Gibbons, Director, Climate Center and Program Manager, GLISA, University of Michigan
• John Austin, Director, Michigan Economic Center, Ann Arbor, MI
• Carol Howe, Director, ForEvaSolutions, Pittsburg, PA
Variations on Conference Themes

• Katy Lackey, Water Environment Research Foundation
• Derek Kauneckis, Voinovich School, Ohio University
• Tom Denbow, Biohabitats
• Bryan Stubbs, Cleveland Water Alliance
• Sanda Kaufman, Levin College, CSU
